

Recycling in the Circular Economy

Ferran Rosa, Policy Officer

A circular economy

Conditions for circular economy

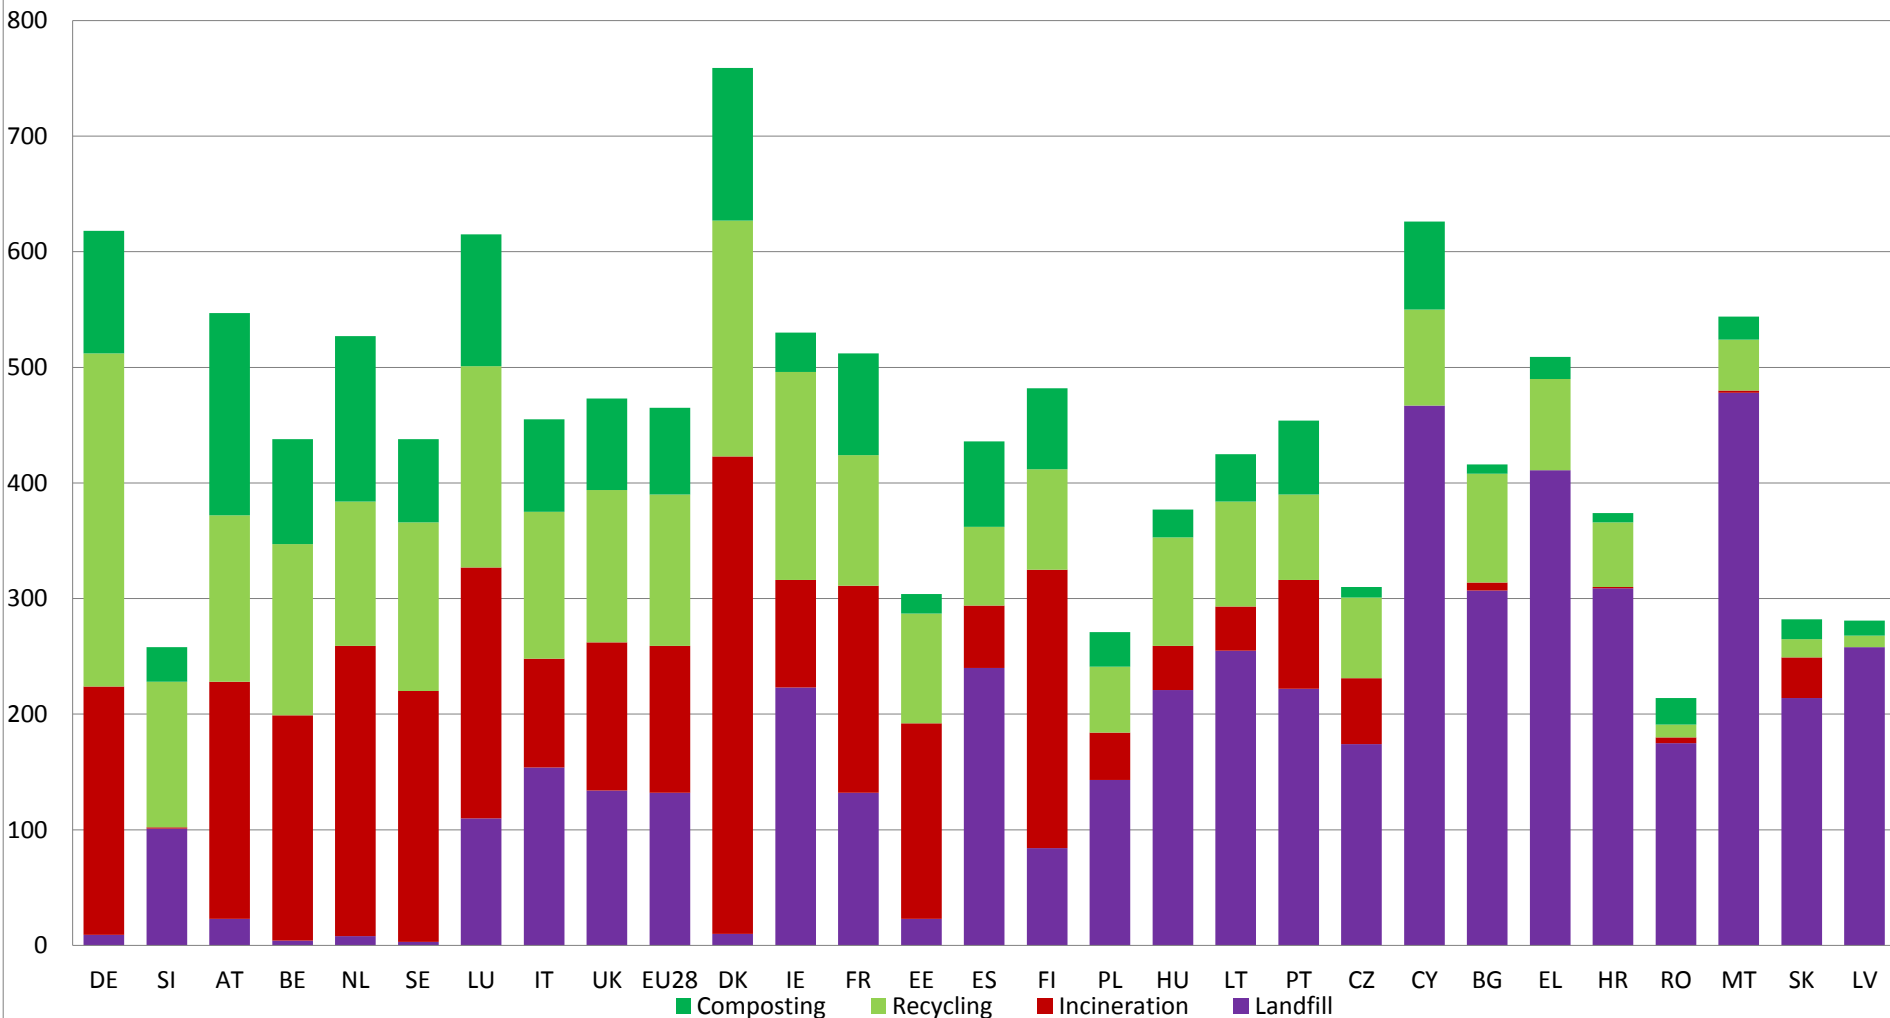

Repair & Recycling are **easier & cheaper**:

1. Economically competitive with end-of-pipe treatments
1. Constant materials are collected & supplied
1. Clean & quality materials are supplied

How are we?

Municipal waste by treatment in 2014 in kg per capita

How are we?

Still a far from circularity...

1. Landfills are cheap, waste-to-energy is subsidised
1. Separate collection is insufficient
1. Products aren't designed for their end-of-life

EP can help solving it

Elements to improve on EC's proposal

- Targets to secure investments & proper implementation
- Effective separate collection (no TEEP)
- EPR schemes to drive eco-design
- Prevention measures & objectives, among others for non-recyclable

Need to bring coherence with other EU policies
